EXAMINER'S AMENDMENT & REASONS FOR ALLOWANCE

I. EXAMINER'S AMENDMENT:

An examiner's amendment to the record appears below. Should the changes and/or additions be unacceptable to applicant, an amendment may be filed as provided by 37 CFR 1.312. To ensure consideration of such an amendment, it MUST be submitted no later than the payment of the Issue Fee.

Authorization for this examiner's amendment was given in a telephone interview with Mr. Rodney Rothwell (Reg. No. 60,728) on 09/20/2010.

The application has been amended as follows:

In the Claims:

 (Currently Amended) A method of representing and managing rich text for use by Web based applications and browsers as implemented in a machine, the method comprising the steps of:

Art Unit: 2176

providing one or more classes for use by the applications to at least create and manage one or more rich text nodes in a memory structure representation representative of rich text:

representing the rich text in the memory structure representation; and editing the rich text in a document using the memory structure representation to perform editing functions on the document having the rich text as managed and created by the one or more classes, wherein the memory structure representation comprises:

forming a table structure represented in memory as a set of special rich text node types including table node, table body node and table header node for defining table characteristics, wherein the table row node, heading cell node and row cell node correspond to types of https://html hyper-text markup language (HTML) tags controlling table representation, wherein

each type of node maintains a reference to the nodes it controls for a next level including the table row controlling a list of row cell nodes, and the table body node controlling a list of table row nodes,

the header cell node and row cell node maintain lists of the rich text nodes, representing content of the rich text nodes and the rich text node contains an anchor point to another table node to start a new table at that point in the rich text thereby allowing for nested tables; and further comprising:

providing a method to transform text from its memory format into string representations and vice versa, comprising:

Art Unit: 2176

storing one of the rich text as a string in a relational database, formatting the string by converting the rich text into a html HTML string for storage, converting the rich text into xml Extensible Mark-up Language (XML) and using a compressed format where various attributes of each rich text node are captured, along with the text value for that node, wherein creating rich text memory structure from html HTML, comprises one of:

parsing, by the rich text node, a well-formed segment of html HTML and set its attributes accordingly, including creating other rich text nodes as needed as the html HTML indicates a change in text attributes or presence of an image or link; and

as a function in a rich text list, taking the html HTML that is not well formed, and preprocesses the html HTML to make it recognizable by the rich text nodes, wherein the rich text list also handles creating the nodes for the table structures included within the html HTML;

parsing the HTML by extracting tag information from a text attribute, then using the tag information to set other attributes in the rich text by calling a resolveTag method, wherein the resolveTag method comprises:

reading text up to a first tag and if this is not a null string, cloning a current rich text node and making the clone a preceding node, and assigning to it all text before the first tag, then removing the text and calling the resolveTag method again, wherein the HTML is well formed for the cloning to work recursively, and the well formed HTML ensures that encountered tags are in proper order so that the text sent to the clone will not miss any tags:

Art Unit: 2176

if the tag has a matching end tag, checking if there is any text beyond the end tag, and if there is, cloning the current rich text node, making the clone the following node, and assigning it the text after the end tag, then removing the text and calling the resolveTag method again;

if the tag is an image or link tag, cloning the current rich text node and making the clone the following node, and assigning the following node the text after the tag:

passing the tag information to resolve the tag and to set up tag attributes, wherein if there is an image or link tag, the attributes are stored in the text; and

if preceding or following nodes are not null, call resolveTag making the preceding or following node the current node, which recursively propagates more rich text nodes to fully represent the rich text.

 (Original) The method of claim 1, wherein the providing the one or more classes includes the steps of:

providing a rich text list class for managing the one or more rich text nodes in the memory structure representation;

providing a rich text class to create the one or more rich text nodes each representing a unit of rich text and its attributes; and

instantiating the rich text list class and the rich text class.

 (Previously presented) The method of claim I, wherein the representing rich text step includes representing the string representations.

Art Unit: 2176

4. (Currently Amended) The method of claim 3, wherein the string representations

comprise at least one of a character large object (CLOB), hyper-text markup language

(HTML) HTML, extensible markup language (XML) XML, plain text, and spell check

text.

5. (Original) The method of claim 1, wherein the providing one or more classes step

includes providing rich text attributes, wherein the attributes include at least one of font

face, font size, font color, italicized, underlined, and bold.

6. (Original) The method of claim 1, wherein the providing one or more classes step

includes providing properties associated with the one or more rich text nodes, the

properties comprising at least one of a line break, a table, an image, a link, and text.

7. -11. (Canceled)

12. (Previously Presented) The method of claim 1, further comprising the steps of:

providing well-formed segments of text to a current rich text node of the one or

more rich text nodes from a rich text list node;

parsing the well-formed segments of text; assigning unparsed segments of text to

the current rich text node's text attribute; and

resolving the current rich text node's text attribute by extracting tag in formation and setting attributes in the current rich text node, the attributes including at least one of font face, font size, font color, italicized, underlined, and bold.

13. (Original) The method of claim 12, wherein the providing well-formed segments step comprises the steps of:

suppressing certain tags associated with some the unparsed segments by changing starting and ending tags to substitution strings;

checking whether the starting and ending tags are in proper order and eliminating pairs of the starting and the ending tags that have null content;

converting some of the substitution strings to original values; and reconstituting the well-formed segments of text into one string when pairs of starting and end tags are eliminated.

14. (Original) The method of claim 12, wherein the providing well-formed segments step comprises the steps of:

restoring table related tags; and

breaking the well-formed segments at table tags and organizing the broken segments into a new rich text list node with entries of at least one of vectors and string.

 (Original) The method of claim 12, wherein the text is at least one of hypertext mark—up language (html) HTML and extensible mark-up language (xml) XML.

Art Unit: 2176

16. (Previously presented) A method of representing and managing rich text for use

by applications as implemented in a machine, the method comprising the steps of:

providing one or more classes for use by the applications to at least create and

manage one or more rich text nodes in a memory structure representation representative

of rich text; representing the rich text in the memory structure representation; and

editing the rich text in a document using the memory structure representation to

perform editing functions on the document having the rich text as managed and created

by the one or more classes, further comprising the steps of:

providing well-formed segments of text to a current rich text node of the one or

more rich text nodes from a rich text list node;

parsing the well-formed segments of text;

assigning unparsed segments of text to the current rich text node's text attribute;

and

resolving the current rich text node's text attribute by extracting tag information

and setting attributes in the current rich text node, the attributes including at least one of

font face, font size, font color, italicized, underlined, and bold;

wherein the resolving step comprises the steps of:

a) reading the text attribute up to a first tag;

b) if the reading step produces a non-null string, then cloning the current rich text

node to make a preceding rich text node and assigning to it all text before the tag;

c) checking whether the first tag has a matching end tag;

Art Unit: 2176

d) if there is a matching end tag, cloning the current rich text node to make a

Page 9

following rich text node and assigning to it any text after the matching end tag, then

removing the text after the matching end tag;

e) resolving the information between the first tag and matching end tag to set up

attributes in the current rich text node; and

f) repeating steps a) through e) until a null string is produced in step b).

17. (Original) The method of claim 16, further comprising the step of repeating steps

a) through f) on one of the preceding rich text node and the following rich text node.

18. (Original) The method of claim 16, further comprising the step of when the first

tag is one of an image tag and a link tag in step a), cloning the current rich text node to

make the following rich text node and assigning to the following node the text after the

first tag, then continuing with step c).

19. (Original) The method of claim 1, further comprising the steps of:

responding to a request for editing a document containing the rich text;

presenting rich text editing controls for editing the document; and

accepting changes to the document using one or more classes including a rich text

class and a rich text list class for editing the document.

Art Unit: 2176

20. (Original) The method of claim 19, wherein the accepting changes step includes

accepting changes to at least one of a table, a link, an image, and text.

21. (Original) The method of claim 19, wherein the responding step further comprises

steps of:

responding to a spell checking request;

presenting a spell check panel that displays spelling alternatives to a misspelled

word associated with the one or more rich text nodes; and

accepting a spelling substitution.

22. (Original) The method of claim 21, wherein the responding to a spell checking

request step includes searching a spelling dictionary to locate one or more words for

presentation in the spell check panel.

23. (Original) The method of claim 22, wherein the one or more words in the

dictionary each have one or more associated signatures to aid in locating a match for the

misspelled word.

24.-35 (Cancelled)

Art Unit: 2176

36. (Previously Presented) A method of representing and managing documents

having rich text for use in a machine, the method comprising the steps of:

representing rich text in a memory structure representation;

providing one or more classes for use by the applications to create the memory

structure representation, the one or more classes including a rich text list class to create a

rich text list node and to manage one or more rich text nodes and a rich text class to create the one or more rich text nodes each representing a unit of the rich text; and

providing well-formed segments of text to the one or more current rich text nodes

from a rich text list node to initialize the current rich text nodes for representing rich text

in a document,

wherein the providing well-formed segments of text step further comprising the

steps of:

parsing the well-formed segments of text;

assigning unparsed segments of text to the current rich text node's text attribute;

and

resolving the current rich text node's text attribute by extracting tag information

and sets attributes in the current rich text node, the attributes including at least one of font

face, font size, font color, italicized, underlined, and bold,

wherein the resolving step comprises the steps of:

a) reading the text attribute up to a first tag;

Art Unit: 2176

b) if the reading step produces a non-null string, then cloning the current rich text

node to make a preceding rich text node and assigning to it all text before the tag;

c) checking whether the first tag has a matching end tag;

d) if there is a matching end tag, cloning the current rich text node to make a

following rich text node and assigning to it any text after the matching end tag, then

removing the text after the matching end tag;

e) resolving the information between the first tag and matching end tag to set up

attributes in the current node; and

f) repeating steps a) through e) until all a null string is produced in step b).

37. (Original) The method of claim 36, further comprising the step of repeating steps a)

through f) on one of the preceding rich text node and the following rich text node.

38. (Original) The method of claim 36, further comprising the step of when the first tag is

one of an image tag and a link tag in step a), cloning the current rich text node to make

the following rich text node and assigning to the following node the text after the first

tag, then continuing with step e).

39. -47 (Canceled)

Art Unit: 2176

48. (Currently Amended) A computer program product comprising a <u>non-transitory</u> computer <u>usable readable storage</u> medium having a computer readable program code embodied in the medium, the computer program product includes:

a first computer program code to provide one or more classes for use by Web based applications and browsers to at least create and manage one or more rich text nodes in a memory structure representation representative of rich text;

a second computer program code to represent the rich text in the memory structure representation;

a third computer program code to edit <u>the</u> rich text in a document using the memory structure representation to perform editing functions on the document having rich text as managed and created by the one or more classes; and

at least one further computer program to parse https://html.html by extracting tag information from a text attribute, then using the tag information to set other attributes in the one or more rich text nodes by calling a resolveTag method, wherein the resolveTag method comprises:

reading text up to a first tag and if this is not a null string, cloning a current rich text node and making the clone a preceding node, and assigning to it all text before the first tag, then removing the text and calling the resolvetag method again, wherein the httml HTML is well formed for the cloning to work recursively, and the well formed httml HTML ensures that encountered tags are in proper order so that the text sent to the clone will not miss any tags;

if the tag has a matching end tag, checking if there is any text beyond the end tag, and if there is, cloning the current rich text node, making the clone the following node, and assigning it the text after the end tag, then removing the text and calling the resolveTag method again;

if the tag is an image or link tag, cloning the current rich text node and making the clone the following node, and assigning the following node the text after the tag;

passing the tag information to resolve the tag and to set up tag attributes, wherein if there is an image or link tag, the attributes are stored in the text; and

if preceding or following nodes are not null, call resolveTag making the preceding or following node the current node, which recursively propagates more rich text nodes to fully represent the rich text.

- 49. (Original) The computer program product of claim 48, wherein the computer program product further includes:
- a fourth computer program code to provide a rich text list class for creating rich text list nodes and for managing the one or more rich text nodes in the memory structure representation;
- a fifth computer program code to provide a rich text class to create the one or more rich text nodes each representing a unit of rich text and its attributes; and a sixth computer program code to instantiate the rich text list class and the rich text class.

Art Unit: 2176

50. (Original) The computer program product of claim 49, wherein the computer

program product further includes:

a seventh computer program code to provide well-formed segments of text to a

current rich text node from a rich text list node;

an eighth computer program code to parse the well-formed segments of text;

a ninth computer program code to assign unparsed segments of text to the current rich

text node's text attribute: and

a tenth computer program code to resolve the current rich text node's text attribute

by extracting tag information and to set attributes in the current rich text node.

51. (Cancelled)

52. (Currently Amended) The method of claim [[51]] 1, further comprising:

buffering, within each segment html HTML, tags that are not of interest by

changing start end and end brackets to substitution strings, which includes a table and list

related tags, which are ignored and restored later;

checking to ensure that the tags start and end in the proper order, and each start

tag has a matching end tag within the segment, performed by bubbling up end tags that

do not have matches within the segment, and then eliminating pairs of start and end tags $% \left(1\right) =\left(1\right) \left(1\right)$

that have no intervening content;

reconstituting the segments into one string, using a rich text node separator; and breaking the html HTML into segments at tags, and then organizing the segments into a

new rich text list that includes entries that are either simple strings for rich text node

entries or vectors for table entries.

П. REASONS FOR ALLOWANCE:

Claims 1-6, 12-23, 36-38, 48-50 and 52 are allowed.

The following is an examiner's statement of reasons for allowance:

Interpreting the claims in light of the specification, Examiner finds the claimed

invention is patentably distinct from the prior art of record.

The prior art does not expressly teach or render obvious the invention as recited in

independent Claims 1, 16, 36, and 48.

The features as cited in independent Claims 1 and 48 "parsing the HTML by

extracting tag information from a text attribute, then using the tag information to set

other attributes in the rich text by calling a resolveTag method, wherein the resolveTag

method comprises: reading text up to a first tag and if this is not a null string, cloning a

current rich text node and making the clone a preceding node, and assigning to it all text

Art Unit: 2176

before the first tag, then removing the text and calling the resolveTag method again, wherein the HTML is well formed for the cloning to work recursively, and the well formed HTML ensures that encountered tags are in proper order so that the text sent to the clone will not miss any tags; if the tag has a matching end tag, checking if there is any text beyond the end tag, and if there is, cloning the current rich text node, making the clone the following node, and assigning it the text after the end tag, then removing the text and calling the resolveTag method again; if the tag is an image or link tag, cloning the current rich text node and making the clone the following node, and assigning the following node the text after the tag; passing the tag information to resolve the tag and to set up tag attributes, wherein if there is an image or link tag, the attributes are stored in the text; and if preceding or following nodes are not null, call resolveTag making the preceding or following node the current node, which recursively propagates more rich text nodes to fully represent the rich text", when taken in the context of the claims as a whole, were not uncovered in the prior art teachings.

The features as cited in independent Claims 16 and 36 "parsing the well-formed segments of text; assigning unparsed segments of text to the current rich text node's text attribute; and resolving the current rich text node's text attribute by extracting tag information and sets attributes in the current rich text node, the attributes including at least one of font face, font size, font color, italicized, underlined, and bold, wherein the resolving step comprises the steps of: a) reading the text attribute up to a first tag; b) if

Art Unit: 2176

the reading step produces a non-null string, then cloning the current rich text node to make a preceding rich text node and assigning to it all text before the tag; c) checking whether the first tag has a matching end tag; d) if there is a matching end tag, cloning the current rich text node to make a following rich text node and assigning to it any text after the matching end tag, then removing the text after the matching end tag; e) resolving the information between the first tag and matching end tag to set up attributes in the current node; and f) repeating steps a) through e) until all a null string is produced in step b)", when taken in the context of the claims as a whole, were not uncovered in the prior art teachings.

Dependent claims 2-6, 12-15, 17-23, 37, 38, 49, 50, and 52 are allowed as they depend upon allowable independent claims.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the Issue Fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
